

Fluid and Air Temperature Sensor

Part #SNS-3000, Part #SNS-3001

Temperature Sensor Kit Contents

- 1 - Temperature Sensor
- 1 - 3-ft subharness with connector

If any of the above items are missing, please contact Powertrain Control Solutions.

The air temperature sensor is used for measuring temperature of gases, typically manifold air temperature. The fluid temperature sensor is used to measure engine coolant, transmission fluid, or other liquids with a temperature range of -50 deg F to 300 deg F.

Electrical Connection

The mate to the temperature sensor is a 2-way connector.

The pinout of the temperature sensor is shown below.

Pin	Function	Wire Color
A	Sensor Output	Yellow with Green Stripe
B	Signal Ground	Black with White Stripe

Sensor Output

The temperature sensor is a variable resistance sensor. As temperature increases, the sensor's resistance decreases. The table below shows the output resistance with respect to temperature. Since most electronic devices such as transmission controllers or data loggers do not measure resistance directly, a pull-up resistor is necessary. The voltage output shown on the table is the output of the sensor when it is installed with a 1000-ohm pull-up resistor to 5V. A 1000-ohm pull-up resistor is installed on analog inputs 5 and 6 of the PCS Transmission Controller, and is programmable ON or OFF on analog inputs 7 and 8 of the PCS D200 Dash Logger.
